(Yes I know its €9.99 on Steam) I generally use a basic scientific calculator to play a game. "You have been playing the game long enough and you're actually capable of making good choices on your own now". One interesting aspect about the scientific calculator is that it accepts input from four analog buttons (for an 8 digit number) and one digital button (for a single digit number). The buttons are typically used to format the number for display and perform mathematical operations on it (add, subtract, multiply, divide etc). For example, on a scientific calculator, pressing "2" will multiply two numbers by each other. If the right button is pressed, the result will be displayed as a four digit number (with "0" as the decimal point). This would be handy if I wanted to, for example, multiply two numbers by ten to get the result, but I would have to press the "2" button multiple times. This is where "Avantasia - Legacy of the Duelist" comes in handy. It was developed by a group of volunteers (with the help of some great developers) for the purpose of transforming the 4 analog buttons on the scientific calculator into memory slots that can hold decimal points, fractions and variables. So if the "2" button is pressed a number will be displayed, but if a variable is on the calculator, it will allow me to choose another number that will be used to "multiply" that variable by. This can be useful if I want to change how my opponent plays. For example, if my opponent wants to activate a "script" (a list of effects they want to activate) then they would use the memory slot. The trick here is that the slots are self-adjusting. This means that if your opponent does use the slots then they won't be able to get the same numbers unless the slots are manually adjusted by the player. Also, the calculator is still available (though you need to press the "2" button) and the same can be said for the other analog buttons. This is great for people like me who are not big fans of reading documentation and manuals. You can play "Avantasia" with the calculator and not have to deal with any menus. The graphics and sound are nice and it seems to run well on my laptop (Core i7, 8Gb RAM, SSD, Nvidia 1050 Ti). My advice would be to find a method of getting a better card than the 1050 Ti. I'm sure you could get
