To assess clinical and cosmetic outcomes of the standard and adapted short scar methods of breast reconstruction using acellular dermal matrix (ADM) in a single institution. This is a retrospective study including a total of 56 patients who underwent breast reconstruction using ADM between January 2012 and December 2014. Thirty-two patients were reconstructed with the standard short scar method, and 24 with the adapted short scar method. Patients were evaluated regarding aesthetic outcomes, complications, and patient satisfaction. All patients were followed up for 1 year. The aesthetic results were good to excellent in all patients. The rate of major complications, wound complications, fat necrosis, and infection was 13.6%, 20.8%, 23.2%, and 23.2%, respectively, in the standard group, and 4.2%, 4.2%, and 8.3%, respectively, in the adapted group. No significant differences were observed between groups. Patient satisfaction and the aesthetic results were better in the adapted short scar group. Acellular dermal matrix, especially in the form of a rectangular sheet, is a valuable adjunct in breast reconstruction to provide a safe and reliable method of reconstruction with good aesthetic outcomes and low complication rates. Although in this study, there was no significant difference between the standard and adapted methods, we believe that the adapted short scar method would be a valuable tool in reconstructing an irregular breast defect.Q: how to send printstream with FTP connection in java I'm trying to send a custom stream to a server over an FTP connection. I have a logging class that writes the contents of the file to a PrintStream, called logStream. I can send the stream to the server, but nothing I send is being written to the server. The following code is in the main class (the bit that runs my server): //GET THE LOG FILE FOR THIS COMPUTER String logfile = "C:\\log\\site.log"; 2d92ce491b
