Aprox fishbot 3.3.5a With the development of the automation market, computer controlled robots are used for the automatic handling of products. These robots not only support the consumer in his choice of product but are also used for improving the processing steps. As a result, a business can benefit from these approaches in terms of reduced costs, increased flexibility and an enhanced quality level. By the use of scanning technology, this system is able to detect the product and quickly transfer the product to the packaging station.

Additionally, the fishbot is able to replace defective products. Any goods in the packaging area or in the warehouse are the target of the fishbot. When it approaches a product, it detects its coordinates and its relevant characteristics, such as color, type, weight or dimensions.

Thanks to the cutting-edge technology of vision system, it is able to detect the product and to place it automatically on the scale. The automated system is equipped with a conveyor belt with a glass counter and a laser scale. The automation system features two conveyor belts, one of which is driven, while the other one can be selected depending on the product. The system is controlled by an easy-to-use workstation. Furthermore, the system is configured with an application programming interface (API). All the settings of the system are configured through a web interface. As a result, a customer can perform maintenance tasks or changes to the fishbot configuration without the need to visit the installation of the system. The API is compatible with all leading integration platforms. The customer can configure the fishbot through the online platform or through a mobile app. Integration of the fishbot with the existing system is easy. The

API provides a complete documentation. Productivity In order to provide a flexible and quick way of manufacturing, the fishbot is equipped with a package handling system. The robot is able to package the product, to feed it into the package or remove the package when it is closed. The fishbot has a package detection system which is able to detect the package shape. The system is equipped with four cameras which are able to detect the package details. The package detection system of the fishbot is able to automatically scan the package, identify the product and feed it into the package. The system of the robot is able to recognize the product type and feed the product automatically into the container or remove it when it is closed. Finally, the
