Best Regards, Paul PaulH August 18, 2009, 10:29 AM Search in the Internet for a registry repair tool. Try to repair the registry using the Windows recovery console. Use the Windows Easy Recovery Essentials. Repair your computer using the Windows System Restore feature. Repair the registry using the DiskPart Wizard (included in the DDK package), but after opening several partition there is no way to see anything. PS: Sorry for the late response. c_gibson August 18, 2009, 11:40 AM 1. You cannot use Windows System Restore if you are not booting from your Windows CD. 2. Start with a System Restore Point. System Restore should be able to save the registry back to a date prior to this incident. 3. Check out the "Advanced System Recovery Options" article on this website and see if it can help you. 4. Check to see if your RAM, CPU and hard drive are properly seated and attached to your motherboard. 5. Check to see if the thermal compound that sits between the CPU and the motherboard is melted. This could cause your motherboard to overheat, and can also cause you to lose data. 6. If the problem continues, you may need to start troubleshooting your computer.
