Field of the Invention The present invention relates to a television signal processing apparatus, a television signal processing method, and a recording medium, and particularly relates to a television signal processing apparatus, a television signal processing method, and a recording medium having a function of specifying the generation point of an invalid signal occurring in a video signal. 2. Description of the Related Art When a television signal is recorded on a recording medium such as a video tape or a DVD (digital versatile disk) after being transmitted from a television broadcasting station, a recording apparatus such as a VTR (video tape recorder) adds a signal for causing sound to be output from the head of the apparatus to an input video signal in order to ensure that the sound is not mixed with the video signal when the signal is reproduced by a television receiver. In addition, when a video signal is recorded on a recording medium such as a video tape or a DVD after being transmitted from a television broadcasting station, the video signal may be subject to the various errors. In this case, in order to ensure that the video signal transmitted from the television broadcasting station can be reproduced correctly, an erasing or invalid signal is added to the received video signal (to be referred to as an invalid signal hereinbelow), and thereafter the invalid signal is encoded by an error correction codec (to be referred to as an EC codec hereinbelow) so that the invalid signal is erased from the video signal. Hence, when a television signal is reproduced from a recording medium, whether the invalid signal remains in the reproduced video signal is detected by a television receiver (i.e., its presence is detected), and when it is detected as remaining, the invalid signal is reproduced and converted into a normal signal. Thereafter, the invalid signal may be employed for a usage, or the invalid signal may be erased from the video signal. In addition, in order to allow a television receiver to have the same function as that of a video tape recorder, a digital video cassette recorder (to be referred to as a VCR hereinafter) is provided with a synchronization detection circuit for detecting the synchronism of a received video signal with a received horizontal synchronizing signal. In the above-mentioned conventional example, when a video signal is reproduced from 3da54e8ca3
