Sequence analysis of a gene-rich region on Xq22.3-24.1 was performed on a series of patients with hereditary mental retardation and/or congenital anomalies. A nonsense mutation, the first mutation reported in this region, was identified in a patient with both Down syndrome and other anomalies and in a patient with several congenital anomalies. The mutation consisted of a G to A transition at position 1057 in exon 13, which resulted in a valine to lysine substitution. No other sequence changes were detected, but a second mutation affecting one of the alleles was observed in two unrelated patients. This substitution, located at position 1275, consisted of a G to A transition. The first mutation may be a new locus in Down syndrome, and it can be distinguished from the second mutation by segregation studies.
