

- Connect/Unplug COM Port Notifier
- It shows you the status of each COM Port on your computer.
- It can also shows you the name of the COM port which is currently used.
- The COM port is a serial communication port that can be used to transfer data between two or more devices such as printers, modems, terminals, and more.
- The COM port is one of the most used devices in a PC and ComPortNotifier shows you the COM port information, which means that if you change the PC, you can still connect your printer, modem or other devices to the new computer.
- ComPortNotifier is very useful for programmers who are developing software solutions or for tech support engineers. It can also be a good tool for virus or malware analysis.
- It's Free!
- Free for personal and educational use.
- Compatible with all Windows versions.
- No C++ or registry settings are needed.
- You can even disconnect the device if the port number is wrong.
- It is very easy to use, doesn't require any installation and is very small in size.

Auto-Copy notifier is a small, easy to use utility that notifies you when the PC is booting and automatically creates backups. The application utilizes its own text file, designated for logging events. The log contains the date and time at which the backup was created, the backup folder name, the type of backup made, the process ID and the parent process name. The utility can be easily configured to launch when the computer starts, using the Windows settings. The user can configure the notification interval and also its settings. The program can be launched with a hotkey and can be added to the Windows taskbar. In addition, you can set the Hotkey for the notification. The application is portable and can be placed on any USB storage device. The app is a perfect tool for system administrators and IT professionals, who must keep track of a system's operation. It is a must have tool if you have multiple PC systems.

Auto-Copy notifier Description:

- Notifier notifies when the system boots and creates backup.
- Notifier allows you to define backup frequency and the system and the file path where backups are stored.
- Notifier notifies the user with a message that asks to save the log file.
- Notifier can be configured to launch at boot.
- Hotkey for the notification can be defined.

#### What's New in the?

MComPortNotifier (COM Port Monitor) is a small utility that has the simple role of monitoring the plug or unplug COM ports. The program works in the background and provides a pop-up when you connect or disconnect any USB device that creates virtual COM ports. The app is as simple as it gets, does not include an interface and can be accessed from the system tray. To put it simply, the application provides you with notifications in the system Tray when you connect or disconnect a device via USB. Therefore, you can immediately know if that port is actually working and the peripheral you are attempting to connect is faulty or working properly. The tool can come in handy for anyone interested in developing and debugging software and hardware solutions that commonly use COM ports for serial data transfer. It is important to note that the application cannot provide more information than whether the port is working and which one is currently being used. It would have been nice if the program included more detailed information or allowed you to record the data going through the serial ports of your computer. Moreover, it can be useful to have the possibility to save the data to a file that you can further examine with other third-party applications.
