AutoCAD has become the most widely used CAD software, and is also one of the best selling desktop applications on the market. Companies have been using AutoCAD for decades, designing everything from skyscrapers to automobiles.

Why is AutoCAD so popular?

Let's take a look at some of the features AutoCAD offers that can help the novice draw complex, professional designs more quickly. Version Control

You don't want to re-create a complex drawing from scratch every time you need to work

on it. AutoCAD lets you quickly check out an existing drawing and make changes, before re-creating it exactly

how you want it. Open a drawing in your Documents folder, and choose File | Open.

You can search for a file by name or type, or browse for one. AutoCAD makes it easy to share drawings with co-workers or other users. Choose File | Publish, or click the Publish icon () in the toolbar, and type a name for your drawing, so you can easily find it again later. AutoCAD's version control system keeps track of all changes to your drawings and lets you roll back to previous versions of your drawings. To check out a file, right-click on it in the Files

Explorer window, choose Check Out from the menu, and click OK. AutoCAD returns a warning window that explains how you can use version control in the future. To check back in, right-click on the file in the Files Explorer, choose Check In, and click OK. Draw Objects Drawing something takes time.

Using the mouse, you can sketch out an object. Using the AutoCAD drawing tools, you can model a 3D object in 2D, and apply all the objects that

make up the object, such as the front and back walls, the roof, and so on. The drawing tools enable you to draw vector paths and objects. You can also draw 2D shapes and create polylines, polygonal shapes, and polylines. The drawing tools in AutoCAD 2017 let you start any drawing session with any type of object. To add a new object to your drawing, choose the drawing tool that you want to use, and then draw the object. You can turn the object on and

off with the On/Off button ().

various plug-ins, such as Digital Projection Tools, WorkPAD, and others.
History AutoCAD began life on 16 September 1984, originally created by Allen Payne, Robert Thurston, and David Crane. Autodesk bought AutoCAD in 1997 from MicroStation Software, Inc.

(the original owner), rebranded the product as AutoCAD LT, and released AutoCAD in 2003. AutoCAD LT is a license-based variant of AutoCAD, providing a more open editing environment than the closed editing model of AutoCAD. AutoCAD LT is priced at US\$2,000 per year and is not compatible with previous AutoCAD files. AutoCAD LT has the ability to read and write DWF files, allowing easy conversion to other vector-

based formats such as VectorWorks. AutoCAD 2014 was released in the second quarter of 2014. AutoCAD LT 2009 was replaced by AutoCAD LT 2013 at the time of AutoCAD's release of 2014. The product formerly known as AutoCAD, the professional version, was renamed to AutoCAD LT in 2006, to emphasize the former product's more basic functions. The product formerly known as AutoCAD LT is the AutoCAD line that is

no longer under development, but is still sold and supported as an alternative to AutoCAD LT. AutoCAD is also available as a subscription model.

Revival of AutoCAD as AutoCAD Classic In June 2018, Autodesk announced a "sister product" to AutoCAD, AutoCAD Classic. AutoCAD Classic, unlike AutoCAD LT, was not built on the discontinued Autodesk Revit platform, but on a new in-house software platform. It is designed for the same uses as

AutoCAD LT, but has a simpler user interface.

AutoCAD Classic can be purchased for £2,500, which is the same price as AutoCAD LT. It is hoped that the new AutoCAD will replace the Autodesk Revit platform, and that AutoCAD Classic will be integrated with that product in future. See also Comparison of

Q: How to get the second matching substring? I want to find the first "co" or "comb" substring in a string. So in the case below, it should return "so", since there is a "co" string, but not a "comb" one. "co", "comb", "loom", "novel", "comb", "loom", "novel" And I can't use strstr() because I only want the first instance. I have looked around and tried looking for something with "a"/"co" in the string, or a "co"

in the string, but I couldn't find anything. A: How about `strstr(str1, "co")`. It will only find the first match. If you want to search for "co" or "comb" in a string, you can use `strstr(str1, "co" | "comb")`. Hope that helps!
