Porphyromonas gingivalis induces high-mobility group box-1 release through TLR4 and NF- κ B. The release of high-mobility group box-1 (HMGB1) in the gingival fluid of patients with periodontal disease is thought to play a pathogenic role. *Porphyromonas gingivalis* is an important periodontal pathogen that may induce HMGB1 release through a Toll-like receptor (TLR)-dependent pathway. This study aimed to investigate the role of TLR4 in the release of HMGB1 induced by *P. gingivalis* in human gingival fibroblasts (HGF). HGF were stimulated with *P. gingivalis* culture supernatants in the presence of an anti-TLR4 blocking antibody or anti-TLR2 blocking antibody. HMGB1 release was measured using ELISA. HGF viability was determined using the MTT assay. Western blot analysis was performed to examine the nuclear translocation of NF- κ B. *P. gingivalis* culture supernatants induced the release of HMGB1 in HGF in a dose-dependent manner. Pre-incubation with anti-TLR4 or anti-TLR2 antibodies significantly inhibited the *P. gingivalis*-induced release of HMGB1. A significant decrease in the viability of HGF was observed after stimulation with *P. gingivalis* culture supernatants. *P. gingivalis* caused the translocation of NF- κ B from the cytoplasm to the nucleus. NF- κ B blockade using the proteasome inhibitor MG132 increased the survival of HGF. Furthermore, the *P. gingivalis*-induced release of HMGB1 was inhibited by NF- κ B blockade. TLR4-dependent NF- κ B activation is involved in the *P. gingivalis*-induced release of HMGB1 from HGF. Effects of alphadihydroguaiaretic acid and its principal metabolite on platelet function. alpha-Di-dihydro-alpha-guaiaretic acid (alphadihydroguaiaretic acid, DHG) is an irreversible inhibitor of lysine acylase, an enzyme of the mammalian
