Plasma cell gammadelta T cell lymphoproliferative disorders with CNS involvement are extremely rare. A 68-year-old male was admitted to our hospital with solitary plasmacytoma of the skull and paraplegia. A few days later he developed blurred vision. A brain MRI showed multiple nodular lesions in the brain. Cranial spinal fluid (CSF) showed pleocytosis. His serum protein electrophoresis was negative, however, urine protein electrophoresis was positive. Bone marrow biopsy revealed interstitial infiltration of plasmacytoid cells. Immunohistochemical analysis showed that the infiltrated cells were monotypic and negative for CD5, CD3, and CD20. The cells were positive for gammadelta T cell receptor and CD56, and negative for CD79a, CD138, and kappa/lambda light chains. Gammadelta T cell receptor rearrangement was positive. He had no peripheral gammadelta T cell lymphocytosis. IGHG4/IgG4 fusion gene, a marker of extranodal gammadelta T cell lymphoproliferative disorders, was negative. The serum level of interleukin-6 (IL-6) was elevated and the level of the paraplegia was getting worse. He was diagnosed with plasma cell gammadelta T cell lymphoproliferative disorder with CNS involvement, and treated with r
