After watching the Concorde fly for its one and only flight, I'm puzzled as to why there were towing vehicles attached to it. I understand that by being towed through the sky, the air currents around it would have a tendency to make it dip one side or the other. But why couldn't they just take off and fly like any other jet? A: The Concorde took off and landed at lower speeds than other jets, and that created significant forces that had to be counteracted to keep it from yawing in pitch, roll or yaw. The best way to counter those forces was to tow the jet while it was flying, as the towing jet can provide a stabilizing yawing moment. Pitch and roll responses to rapid acceleration and deceleration have been attributed to asymmetric responses in the leading and trailing edge flaps, and a variation in the anhedral of the rear fuselage is also supposed to contribute. The interaction of the ailerons and flaps produces a difference in lift in the same manner as that of a leading-edge slat. Aileron hinge-down on one side provides more lift than hinge-up on the other. Source: Concorde: Finishing the deal by John F. Williams The Concorde is not just any other jet. It has a low speed flight profile and is also known to be especially sensitive to drag. In order to keep the jet from becoming unstable at slower speeds and to generate down force, the towing jet's thrust was slowed down and the result of the differential thrust was used to push the Concorde in the direction of the side with more thrust. A variation in the side-thrust forces applied to the Concorde also results in asymmetric roll. The interaction of the leading edge aileron and flap, the angle of attack control surface and the elevator produces an asymmetric roll moment. Source: Concorde: A rare look at a rare aeroplane. A: Synchronizing the touchdown forces of a towing airplane helps to stabilize the Concorde

Q: Prove using induction, that if n is a positive integer, then $(n+1)^2 = n^2 + 2n + 1$ Prove by induction that if n is a positive integer, then $(n+1)^2 = n^2 + 2n + 1$ My solution: The base case: $P(1)$: $(1+1)^2 = 1^2 + 2 \cdot 1 + 1$ $P(k)$ implies $(k+1)^2 = k^2 + 2k + 1$ My step: $P(k+1)$: $(k+1+1)^2 = (k+1)^2 + 2(k+1) + 1$ implies $(k+2)^2 = k^2 + 2k + 2 + 2$ implies $(k+2)^2 = k^2 + 2k + 1 + 2$ implies $(k+2)^2 = (k+1)^2 + 2k + 1 + 2$ And we are done! Is this solution correct? If it is, is there any way to prove this by induction without the L.H.S.? A: Note: I might have made a mistake since I'm not quite sure what you mean by the L.H.S. The inductive step would be $(k+2)^2 = k^2 + 2k + 1 + 2$ which is simply the inductive hypothesis. To prove $(k+2)^2 = k^2 + 2k + 1 + 2$, you can assume the truth of

Overview: In The Golden Age of A.I., players embark on a quest to unravel the secrets of a mysterious power, with the fate of an entire civilization hanging in the balance. As they try to uncover the truth, they encounter an A.I. system gone mad that represents a terrifying, unstoppable force of nature called A.I. In the game, players experience four distinct narratives in three distinct eras, with the characters of these eras designed to be more than one-dimensional. The game builds upon and extends the KOTOR universe of BioWare◆
