Photoshop is an excellent tool for creating digital photo elements from any photo source. In this format, black, white, and grey tones take the place of all colors; and when used this way, there's no need for color correction or other types of color correction. Photoshop is available for both Mac OS and Windows, and its power is enhanced when you use a high-speed hard drive, a card reader, and a digital camera to make use of one of Photoshop's most common feature — saving projects as PDF documents. Some of the most common uses of Photoshop include special effects, image compositing (composing multiple images into one), and retouching and manipulation of images. The following sections discuss many of these uses. After you become comfortable using Photoshop, you can become a full-fledged image designer by adding-in great text, bevels, and other effects to transform photos into much more than just pretty backgrounds. Photoshop and Digital Images Throughout this book, we talk about resizing, cropping, and recoloring images. It is beyond the scope of this book to discuss the finer points of resizing, cropping, and recoloring an image. The size and context of the image has a dramatic effect on the outcome. Your personal tastes are also at play in the final result, and the techniques used in processing a particular image depend on your strategy. Without question, the most common digital image editing program is Photoshop. The most basic aspect of the program is its ability to display an image on a computer screen. Some of the more common uses of Photoshop include the following:

**Creating and editing original images:** To create or edit an image, you typically use the three layers: background, shape, and frame. Place the image on the background, and then apply the different editing styles to the image, including placement, rotation, size, color, and borders. **Retouching and manipulating original images:** You can also apply special effects to alter and manipulate an image. You can resize, crop, recolor, and merge images. You can create a backdrop for a photo shoot, edit and resize an image to give it a special touch, or just recolor an image and end up with a great holiday greeting card.

**Composing and layering multiple images:** If you have access to a scanner or imaging device, your computer comes with a built-in software program that allows you to make your own printed pieces. You can

be an opportunity to showcase some texturing skills. Step 1 Select the Spray tool and press space to activate it. Click and drag within your image to apply the texture. Set the layer's mode to Screen, create a layer, and set the layer's blend mode to Overlay. Step 2 Press Control+Z to undo the last change to your work and return to a cleared state. With the shape layer active, select the Inner Shadow tool from the toolbox and create a new layer. Step 3 Paint the shadow of the text, setting the layer's mode to Soft Light and the Opacity to 60%. With the path selected, click on the Opacity of the layer to access the Tool Options window. In the Transparency tab, select Using: Alpha Channel. Step 4 Set the blend mode of the paths to Multiply and the layer's Opacity to 100%. You can now play around with setting the gradient of this layer to make it more interesting. Step 5 Create a new layer and create a path that covers the same area as the path you just created. Select the Selection tool, hold down the Alt key, and use the Pick tool to click on the bottom of the path. Alternatively, you can select the path then use the technique described in Step 1. Step 6 Use the Direct Selection tool to delete the path. Then use the Eyedropper tool to select the remaining grey paint with which you created the path. Create a new layer and add a layer style to set the opacity to 80%. Step 7 Use the Brushes tool (with the Shape Dynamics panel open) and create a 4-colour simple gradient. With the Add button, click on the foreground colour and make sure

### What's New In?

Q: How to finish application when Enter is pressed in Dialog box (or how to show dialog from activity) I have a program that opens a dialog box every time that a user clicks on a button on screen. The dialog box is supposed to show at the bottom of the screen while the user presses Enter. I have seen applications do this and I am wondering how it is done. To clarify: I don't want to just run a new activity when the user presses Enter in the dialog box.

```
public void onCreate(Bundle savedInstanceState) {
super.onCreate(savedInstanceState); setContentView(R.layout.main); setForeground(false);
setRequestedOrientation(ActivityInfo.SCREEN_ORIENTATION_LANDSCAPE);
if(savedInstanceState != null) { previousState = savedInstanceState.getString("state"); } Button
downButton = (Button) findViewById(R.id.downButton); downButton.setOnClickListener(new
View.OnClickListener() { public void onClick(View view) { if(dialog != null && dialog.isShowing()) {
dialog.dismiss(); } Intent intent = new Intent(view.getContext(), orderAll.class);
startActivityForResult(intent, 100); finish(); } }); } A: Dialogs need a key-down handler, something like
this: @Override public boolean dispatchKeyEvent(KeyEvent event) { switch(event.getKeyCode()){ case
KeyEvent.KEYCODE_ENT
