This is considered a sub-field of graph theory. A graph is a structure amounting to a set of vertices joined by edges. a graph. is a structure amounting to a set of vertices joined by edges. In graph theory this is viewed in a different way to other fields in mathematics such as a graph is a structure amounting to a set of points joined by lines, a graph is a set of vertices joined by edges, a graph is a set of vertices joined by edges and is also connected (connects all vertices to all others, there are no disconnected ones). A graph may be thought of as a geometric object, for example the square lattice (as shown above). In a graph  $G$ , an edge between two vertices denoted by  $u$  and  $v$  is called a  $u-v$  edge.  $G$  is said to be  $k$ -connected if there is a path in  $G$  joining each of its  $k$  vertices to a third vertex. A path is a sequence of vertices connected with edges, and a cycle is a sequence of vertices such that two successive vertices are connected with an edge. As mentioned earlier, a tree is a  $k$ -connected graph with no cycles. A connected graph is a graph with no cycles. A graph is said to be  $k$ -orientable if it can be oriented so that all its edges have either 0 or 2 vertices on one side. A graph is said to be  $k$ -paintable if it can be colored by  $k$  colors so that no two vertices connected by an edge are colored by the same color. A set of vertices of a graph is said to be a separating set if the graph without this set is not connected. The minimum number of vertices required to be removed from a graph so that the resultant is not connected is called the separation number of the graph. A path is called an  $m$ -path if its length is equal to  $m$  and if there are exactly  $m$  edges in the path. A 2-path is a path of length two. S DO 648931e174

The users are asked to choose a color when the initial doc is created, and then choose a second one when they enter text. I have found the following snippet that seems to be the best way to do this:

```
document.getElementById("DocId").addEventListener("change",function(){
getColorScheme(document.getElementById("DocId").value); });
```

The implementation is trivial. The with ID DocId is the one for the currently selected doc. I store the value in a session, and want to use it to change the color of the Doc as well as the text. On the server side, I have: function getColorScheme
