Half-Life 2 Head Shot Portals Game for PC, Mac. Lego Batman 2: DC Super Heroes - Download Full Version for PC. Adobe Animate CC 2015 15.1 Portable[by Robert].rarQ: How do I prove the transitivity of the pseudometric on ordered sets? In my textbook, every proof of transitivity of the pseudometric on a poset starts with some definition of reflexivity, symmetry, and then transitivity. However, I'm having a hard time understanding why every instance of $d(x,y)=d(y,x)$ would be equal to $d(x,y)=0$, what would I need to use instead? Here's an example, the proof of transitivity of the pseudometric on the half-open set in $\mathbb{R}$: Edit: How would I approach proving that every instance of $d(x,y)=0$ also holds? A: It depends on what your definition of $d(x,y)$ is. If you mean $d(x,y)=0$ implies $x=y$, you're done. If you mean "$x=y$ and $y=z$ implies $x=z$", you're OK. If you mean "for all x,y there exists an z such that $x=y=z$", you're looking for a proof by contradiction: Suppose there is no z such that $x=y=z$. Then for any x,y, there is a z such that x e z or y e z. Without loss of generality, suppose x e z. By symmetry, y e z. If $x=z$, we've found an x and y that don't satisfy the axiom $d(x,y)=0$, which is a contradiction. If $y=z$, a similar argument applies. If you're unhappy with this proof by contradiction, here's an alternative. Suppose $d(x,y)=d(y,z)=0$ and $d(x,z)=d(y,z)=0$. Then $$d(y,z)=0=d(x,y)\le d(x,z) = d(y,z).$$ Since
