What's New in the Windows Media Load Simulator 9 Series?

Windows Media Load Simulator 9 Series is a command-line utility that simulates the load on a server by simulating requests from many instances of the Microsoft Windows Media Player client. Windows Media Load Simulator can be configured to simulate a load from a specified list of client instances, or it can be configured to simulate all clients if the number of clients is unknown. When a Windows Media Load Simulator instance simulates requests from a list of client users, a set of log files is generated. The log files are named after the user name of each client. Multiple instances of Windows Media Load Simulator can be run at once from the command line to simulate multiple clients on a server simultaneously. When run from the command line, Windows Media Load Simulator can use a .ini file to specify the number of clients that are running and what kind of client they should simulate. Windows Media Load Simulator simulates client requests using a simulated client implementation. The simulated client implementation has been developed for client simulation. It is intended to be used by client simulators on Windows, and it does not require Windows Media Player. The log files can be opened by Microsoft Windows Media Player or by a third-party log analyzer. The log file format is similar to the Windows event log files, and it has an extension of .rkl. This file extension can be used to open it with any Windows application, including Microsoft Management Console (MMC). To open an R.K.L. file, the first thing to do is double-click on the file to open it with the Microsoft Windows viewer. You then click the File menu, then the Open menu, then the Open Windows Explorer, which opens the folder where the file was saved. You then click the File menu and choose Open or Open With, then click on the file extension to specify the Windows Media Player

application to open the file. Windows Media Load Simulator is not a high-performance network performance tool. It is intended to be run on a client machine to simulate user requests coming from that client machine. It is not intended to test server connection capacity, authentication, or quality of service. Windows Media Load Simulator is only a utility that can be used by programmers, designers, and testers to simulate client requests to Windows Media Services 9 Series servers. It does not test the client or server product. The Windows Media Load Simulator software is not a product, and it is not an emulator. It is not Microsoft Windows Media Software and it does not reproduce or simulate the Windows Media Player client
