Q: C# event-based library for asynchronous tasks I'm looking for a library similar to NServiceBus for Java, which would allow me to perform tasks that don't have to be executed synchronously, and then inform the calling method when the execution is complete. It would have to run on .NET 2.0. I don't want to use WCF because I want to only use the library for .NET projects. Any ideas? A: I use WCF for exactly that sort of thing.

Determination of the metal content in single InP nanowire based on dark-field spectroscopy. The optical properties of a single InP nanowire was investigated using dark field microscope and Raman spectroscopy. A strong exciton emission (1.38 eV) was observed in dark field images. The Raman scattering exhibited in InP nanowire was compared with that from well-defined InP powder. The nanowire has a nearly hexagonal cross-section, whereas the powder displays a round one. The wavelength of exciton emission peak of the nanowire is shifted to longer wavelengths from that of the powder. However, the distance of InP nanowire is greater than that of the powder. It implies that the nanowire shows the negative strain effect. The measured wavelength of Raman scattering peak from the nanowire is red-shifted as compared to that from the powder. This discrepancy originates from the p-orbital of indium atoms that is hybridized with the s-orbital of phosphor atoms of nanowire.

Q: What is the purpose of a (1 or 2) in a Java predicate? What is the use of the (1 or 2) in the following boolean `isEven(int i) { return (i % 2 == 1); }` My understanding is that this is the same as `isEven(i)?`: `boolean isEven(int i) { return i % 2 == 1; }` A: In this example `isEven(i) != isEven(i)` because they do not mean the same thing, even though they compile to the same code. If you see `boolean b = a; if(b) // do stuff` then it does the same thing as `boolean`

Many other tasks, such as applying gradients, masking selections, and creating paths, can be done with tools that you can select from. The Gradient Tool allows you to create gradients by dragging the mouse pointer over an image. Gradients are useful for creating consistent color changes.
